

One tricked agent should not be able to empty the account.

SauronID sets the limits every AI agent has to work inside: what it can spend, send, and reach. It refuses the calls that fall outside them, and keeps a verifiable receipt for the rest. **It runs on your own servers.** Your keys, your logs, your auditor.

THE PROBLEM

0x001

The credentials are valid. That is the problem.

Your agent holds an API key, a card, a database, plus an input box the outside world can write into. One poisoned document, and it does something expensive using credentials that are entirely legitimate. The API has no reason to refuse.

Afterwards the only record is the agent's own log. Identity products answer **who is calling**; the incident is about **what the call was allowed to do**.

Why teams are buying this year

- **Agents crossed into actions.** Money moves, production systems get touched. The blast radius became financial, so containment became a purchase.
- **The regulation landed.** Tamper-proof logging has been obligatory for EU financial entities since January 2025 (DORA RTS 2024/1774); auditors now ask for the agent trail by name.
- **Self-hosting is a requirement, not a taste.** Teams with budget will not route agent traffic through another company's cloud, which rules out the managed-only field.

WHAT THE CUSTOMER GETS

0x002

Damage has a ceiling You set what each agent may spend, send and reach. The limits are enforced outside the agent, so one that has been talked into ignoring its instructions still cannot exceed them.	Every action has a receipt A tamper-evident history per agent: what it called, on whose behalf, allowed or refused. Your auditor verifies it without trusting our word, our copy, or our keys.	Nothing leaves your side One binary in your own infrastructure. If we disappeared tomorrow your deployment keeps running, on source your team can read line by line.
---	--	--

How it holds: every call is signed against its exact payload and the agent's current configuration, spending and network limits are enforced by a separate gateway process, and the audit trail is committed to Bitcoin and Solana so nobody can quietly rewrite it, us included.

THE 16 REFUSED, BY NAME
A1 forged token · A2 token replay · A3 call-signature replay · A4 cross-endpoint token reuse · A5 body tampered after signing · A6 stale timestamp · A7 another agent's key · A8 admin call without the key · A9 revoked agent still acting · A10 scope creep on delegation · A11 concurrent double-claim of a consent token · A12 registration flooding · A13 CORS origin fallback · A14 audit log tampered after the fact · A15 timing oracle on session compare · A16 agent config drift.

BUSINESS

0x003

Sell the narrow case first Not "identity for all agents", but agents that spend money or touch sensitive systems, where caps, payment approval and per-action receipts are the whole reason the buyer called. That buyer is the platform, infra or security lead who owns the incident.	Two SKUs, one build Support and deployment certification sells this quarter with zero new code. The managed option is the destination and the route to SOC 2. Every support customer is a lead for it.	Why the position holds Client libraries are Apache-2.0 and act as the funnel. The gateway is BUSL-1.1: buyers read and audit every line, no cloud vendor resells it as their own service. Copyright is founder-owned.	
0 to 5k € 4-WEEK DESIGN PARTNER PILOT	15 to 40k € / yr SUPPORT + CERTIFICATION, NOW	25 to 60k € / yr MANAGED GATEWAY, NEXT	Hypothesis PRICING, NOT YET VALIDATED

WHERE WE ACTUALLY ARE

0x004

Built, not slidewared

First commit 26 April 2026. Today: 92k lines of Rust, 724 tests in the release gate, a live cloud demo, one-command install, and the procurement pack already written: security questionnaire, DPA, production-readiness.

Commercially

Pre-revenue. Prospect conversations in the money-agent wedge, no signed pilot yet. The next 90 days are design partners, not ARR. Three founders, all shipping code: Nicolas Bigeard, Clément Sporrer, Killian Provin.

What we do not claim

No certification and no independent audit report yet; HA is roadmap. SauronID contains an agent, it does not prove one is well-behaved. A limit set too generously still authorizes harm. Those tables ship with the code.

THE ASK

500k € pre-seed, to turn a working product into one a security team can buy without an exception.

- **Independent audit.** The gate that turns "you can read the source" into a procurement pass, and the line item your audit cover funds directly.
- **Hosted on our own compute.** A cloud option beside the self-host, the way n8n sells both: teams start in minutes, the regulated ones still run it themselves.
- **Marketing.** Turn an open-source funnel into pipeline, and the first design partners into named references in the money-agent wedge.
